

What's New in Digital Health for Private Specialist Practices?

PHN EDUCATION SESSION

Digital health provides us with a toolbox of technologies and techniques that support the development of new, innovative patient and caregiver-centred models of care, driving improved engagement, accessibility, quality, safety, efficiency and sustainability into all corners of the health system. This webinar will expand the knowledge of digital health technologies available to specialist practices, focusing on adopting and using My Health Record and other digital initiatives such as ePrescriptions, eRequests for pathology, and eReferrals.

In addition to examining how these digital health tools can improve access to healthcare information, support practice workflow, and enhance patient care, the team will provide information on the foundational requirements for specialist practices to access them.

At the end of this session, attendees will be able to:

- Recognise the benefits of My Health Record and what's in it for your practice and patients
- Identify the privacy and security requirements for accessing My Health Record
- Describe how ePrescriptions, eRequesting of pathology and receiving eReferrals can add value to the practice workflow and benefit patient access to healthcare
- Name the foundational requirements for using Digital Health in practice, including PRODA, HPOS and NASH PKI certificates and where to obtain support for these.
